

Wheelie bins are not to be manually lifted into industrial bins

Queensland Department of
Education and Training
Health and Safety Fact Sheet
(June 2014)

Waste is a problem

There will always be waste. A growing population means an increase in rubbish, and more rubbish means an increase in manual waste handling processes, like emptying bins into skips.

In their recently published *Waste Management Health and Safety Fact Sheet, June 2014*, the Queensland Department of Education and Training directed that:

'Wheelie bins are not to be manually lifted into industrial bins.'

'If wheelie bins are to be emptied into an industrial bin then an appropriate lifting device is to be provided.'

The same publication also outlined a series of recommendations for schools when purchasing a bin lifter:

'The purchase of (bin) lifters with crank handles or foot pumps is not recommended due to injury risks...'

'Fully enclosed styles of bin lifter are available to minimise the risk of pinching, amputation and impact injuries. These types of devices have guards on moving parts and pinch points as well as eliminating operator exposure to debris from the bin as it empties.'

We have the solution

The Liftmaster *Simplicity Plus* and *Universal* bin lifters allow a single operator to empty wheelie bins safely & efficiently, whilst reducing the risk of back and side strain. They are designed and built right here in Australia, to Australian Standards, and are suitable for 80, 120 and 240 litre bins used in most Australian Schools.

Powered by a push button hydraulic system, and safety features like two handed operation, grilles, and in the *Universal*, a safety door, these bin lifters make emptying wheelie bins on school grounds a safe and effortless process.

Liftmaster bin lifters are the best bin lifters on the market. Call us today on 1800 333 002 to find out how we can help you keep your staff and students safe.
